Field	Value
Product	Handoff (Meeting Action Items to Slack)
Document	Business Requirements Document (BRD)
Version	1.0
Status	Draft for client review
Author	Subhan Abdullah, Project Manager
Client sponsor	Head of Operations (client)
Course context	M2 Digital Project Management, Week 1: Build First Project Tool
Related documents	Handoff PRD v1.0, README, Brand kit

Executive summary

Handoff cuts the time to send a meeting's action items to Slack from about 15 minutes to about 3, without building a new platform.

Today someone reads each transcript, copies out who agreed to do what, and types a Slack recap by hand. The client asked for a simple tool that does four things: take a transcript, find action items and owners, let a person review them, and post the final update to Slack.

Handoff is a single web page with no accounts and no database. It extracts action items in the browser, shows them in an editable list, and posts the approved recap through a Slack incoming webhook. The client's instruction to keep it lean is treated as a requirement, not a preference: every feature request is tested against the four jobs above.

Business problem and current process

The team loses time and follow-through because action items are pulled out of meeting notes by hand.

Client statement: "We're wasting time manually pulling action items from meeting notes and sending Slack recaps."

Current process (as-is)

1. The meeting ends and the notetaker exports or opens the transcript.
2. The notetaker reads the full transcript to find commitments and requests.
3. They work out who owns each item and any due date mentioned.
4. They type a recap message in Slack, formatting it by hand.
5. Owners reply in thread when something is wrong or missing.

Pain points

- **Time:** about 10–20 minutes per meeting is spent on a clerical task (to be confirmed with the client).
- **Missed items:** commitments made in passing ("I can take that") are easy to overlook.
- **Unclear ownership:** items like "we need someone to…" go out with no owner.
- **Delay:** recaps are often sent hours later, after the team has moved on.
- **Inconsistency:** each notetaker formats the recap differently, so owners scan for their name.

Business objectives and success metrics

Success means recaps go out faster, with owners on every item, and the team keeps using the tool after the first month.

Objectives follow the SMART format. Baselines are estimates until measured in week 1 of the pilot.

#	Objective (SMART)	Metric	Baseline	Target	Measured by
O1	Cut the time to produce a meeting recap within 4 weeks of launch	Minutes from transcript in hand to recap posted	~15 min	⩽ 3 min	Timed sample of 10 meetings

#	Objective (SMART)	Metric	Baseline	Target	Measured by
O2	Every posted action item has a named owner by week 4	% of posted items with an owner	Unknown	≥ 95%	Count in posted recaps
O3	Recaps go out the same day as the meeting	% of meetings recapped within 1 hour	Unknown	≥ 80%	Slack post time vs meeting end
O4	Extraction is good enough that review stays quick	% of extracted items kept without rewriting	n/a	≥ 70%	Pilot review log
O5	The team adopts it	Meetings recapped with Handoff ÷ recurring meetings	0%	≥ 75% by week 6	Weekly count

Stakeholders and RACI

The client sponsor approves scope; the notetaker is the primary user; owners only read the Slack post.

Stakeholder	Role	Interest
Client sponsor (Head of Operations)	Requested the tool, approves scope and budget	Time saved, follow-through
Meeting notetaker	Primary user: pastes transcript, reviews, posts	Speed, accuracy, little setup
Action item owners	Receive the Slack recap	Clear task, owner, due date
Slack workspace admin	Approves the incoming webhook	Security, channel hygiene
Project manager (Subhan Abdullah)	Delivers the tool and documents	Scope, quality, schedule

RACI (R = Responsible, A = Accountable, C = Consulted, I = Informed)

Activity	Sponsor	PM	Notetaker	Slack admin	Owners
Approve scope (BRD/PRD)	A	R	C	I	I
Build and test the tool	I	A/R	C	I	–

Activity	Sponsor	PM	Notetaker	Slack admin	Owners
Set up the Slack webhook	I	C	I	A/R	–
Pilot (4 weeks)	A	R	R	I	C
Measure success metrics	A	R	C	–	I
Go / no-go after pilot	A/R	C	C	I	I

Scope

Version 1 does the four jobs the client named and nothing else; everything else waits for evidence from the pilot.

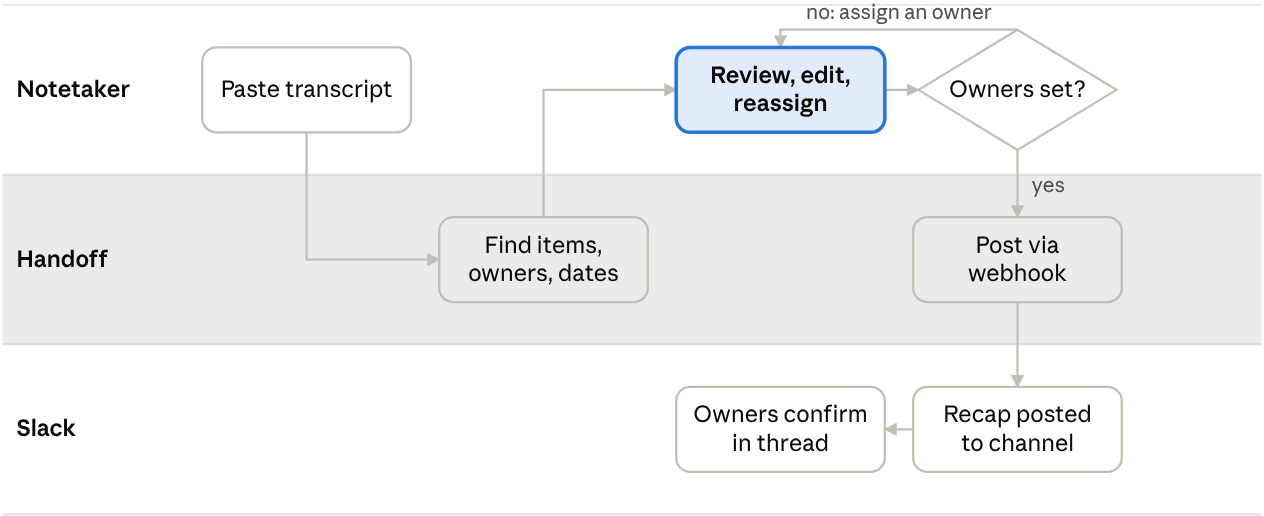

In scope (v1)	Out of scope (v1)
Paste a text transcript (Zoom, Meet, Teams or typed notes)	Joining or recording meetings, audio transcription
Find action items, owners and due dates automatically	Task tracking after posting (status, reminders, completion)
Review screen: edit, add, remove, reassign items	User accounts, logins, team workspaces
Preview the Slack message before posting	Storing transcripts or history in a database
Post to one Slack channel via incoming webhook; copy as fallback	Real @mentions that notify users (needs a Slack app and user IDs)
Runs in a browser with no install	Integrations with Jira, Asana, email or calendars
	Analytics dashboards

Scope guardrail: a new feature enters v1 only if the notetaker cannot complete one of the four jobs without it.

Future process (to-be)

The notetaker spends their time on judgment (is this right, who owns it) instead of copying and formatting.

The notetaker approves every item before anything reaches Slack

to-be process · 3 lanes, 7 steps, 1 decision

Handoff does the reading and formatting; the person keeps the decision. Nothing posts until the notetaker has reviewed the list, and an item without an owner is flagged before posting.

High-level business requirements

Eight requirements cover the client's four jobs plus the constraints that keep the tool lean and safe. Detailed functional requirements and acceptance criteria are in the PRD.

ID	Requirement	Client job it serves	Priority
BR-1	Accept a meeting transcript as pasted text from common tools	Take a transcript	Must
BR-2	Identify action items, their owners and any stated due dates	Identify items and owners	Must
BR-3	Let a person edit, add, remove and reassign items before sending	Quick review	Must
BR-4	Post the approved recap to a chosen Slack channel	Post to Slack	Must
BR-5	Show exactly what will be posted before posting	Quick review	Must

ID	Requirement	Client job it serves	Priority
BR-6	Complete a typical recap (30–60 min meeting) in under 3 minutes	All	Must
BR-7	Need no accounts, installs or new systems to adopt	Keep it lean	Must
BR-8	Keep meeting content private: nothing stored, only the final recap leaves the browser	Keep it lean / trust	Must

Assumptions, constraints and dependencies

Assumptions

- The team already gets text transcripts from its meeting tool or writes notes with speaker names.
- Transcripts are in English for v1.
- One Slack channel per recurring meeting is enough; the notetaker picks the webhook for that channel.
- A person always reviews before posting; the tool is never expected to be 100% accurate.

Constraints

- Client instruction: "Keep it lean. Don't let this turn into a massive platform."
- Course timebox: one week to build and document.
- Budget: no paid services required to run v1.

Dependencies

- A Slack workspace admin creates an incoming webhook for the target channel.
- A modern browser (Chrome, Edge, Firefox or Safari, current versions).

Risks and mitigations

The biggest risk is scope creep, which the client named directly; the second is extraction misses, which the review step contains.

ID	Risk	Likelihood	Impact	Mitigation	Owner
R1	Scope creep turns the tool into a task-management platform	High	High	Scope guardrail; change requests need sponsor approval; out-of-scope list in this BRD	PM
R2	Extraction misses items or picks the wrong owner	Medium	Medium	Mandatory human review; source quote shown per item; "needs owner" flag	PM
R3	Transcripts in unusual formats are not parsed	Medium	Medium	Support the common "Name: text" format; manual add; collect samples in pilot	PM
R4	Webhook URL is leaked and someone posts to the channel	Low	Medium	Kept in the browser tab only; never stored or logged; admin can rotate it	Slack admin
R5	Low adoption: notetakers keep the old habit	Medium	High	3-minute demo; pilot with 2 recurring meetings first; measure O5 weekly	Sponsor
R6	Sensitive meeting content leaves the company	Low	High	Processing runs in the browser; no server, no third-party AI in v1	PM

Cost-benefit estimate

On the working assumptions below, Handoff pays back its build cost in about 13 weeks and returns roughly €5,500 of time per year.

Item	Assumption	Value
Recurring meetings recapped	15 per week	–
Time saved per recap	15 min → 3 min	12 min
Time saved per week	15 × 12 min	3 hours
Time saved per year	46 working weeks	138 hours
Loaded cost of staff time	Estimate	€40 / hour
Annual benefit	138 h × €40	€5,520
One-off build cost	~40 hours × €40	€1,600

Item	Assumption	Value
Running cost	Static page, Slack webhook is free	€0 / year
Payback period	€1,600 ÷ €120 per week	~13 weeks
Year-1 ROI	(€5,520 − €1,600) ÷ €1,600	~245%

Not counted: fewer dropped commitments and faster follow-through, which are likely the larger benefit but hard to price. All figures are to be replaced with pilot measurements in week 4.

Approval

Signing below approves the v1 scope above and the 4-week pilot.

Role	Name	Decision	Date
